

Repository Status Report: scottyab/rootbeer

Analysis

This report analyzes only source files from the RootBeer repository. This includes .java, .kt, .cpp, and .h files. For each source file, the history of commits (author + date) and total count is recorded.

Key Findings

RootBeer.java is the most active file. It was changed 40 times, or just over 20% of all 196 recorded source-file touches. The next most frequently changed files were Const.java (17) and MainActivity.java (11). This concentration suggests that RootBeer.java is a key file to monitor.

Repository knowledge is concentrated in a small number of contributors. Scott Alexander-Bown made 74 recorded file touches and Matthew Rollings made 58. Together they account for over 67% of all recorded source-file changes, creating a potential knowledge concentration risk if future maintenance depends heavily on a small number of experienced contributors.

Development activity slowed down after the repository's early years. The dataset records 68 source-file touches in 2015, followed by lower and uneven activity in later years.

Plot

This visualization displays a plot of each source file change by week since the first recorded commit. Each row on the y axis represents a different file, and each color represents a different author.
