

Rootbeer Repository Analysis - Summary

Repository: <https://github.com/scottyab/rootbeer>

Analysis

This document analyzes and visualizes commits to source files from the rootbeer repository. Source files include Java (.java), Kotlin (.kt), and C++ (.cpp/.h) files.

Findings

- default branch: master
- 36 source file paths
- 196 source file commits
- 20 contributors

Two contributors account for more than 60% of the commits. Scott Alexander-Bown (scottyab) and Matthew Rollings (stealthcopter) contributed 37.76% and 29.6% of the commits respectively, implying more familiarity with the codebase.

Commit activity is concentrated in a few files. Out of the 36 source files: Rootbeer.java (40 changes), Const.java (17 changes), and MainActivity.java (11 changes) are the only files with more than 10 commits. Together they account for 34.6% of the 196 source file commits. This implies importance.

Limitations

Source file selection might exclude other language source files outside of Java (.java), Kotlin (.kt), and C++ (.cpp/.h/.hpp). For example, kotlin script (.kts) was excluded, but could be considered a source file.

Plot

The visualization shows the source files on the y-axis, weeks since first commit on the x-axis, and the contributors as points with different colors. Columns with the same contributor imply the contributor may have more knowledge of the codebase.
